

EpisodeSleuth - Responsive Layout Test Report

Date: 2026-09-09

Scope: Main-window layout improvements (splitter, adaptive button bar, window-geometry persistence, minimum window size) verified across the three requested target resolutions plus a minimum-size stress case.

How these results were produced

The GUI is a PySide6 / QFluentWidgets desktop application, so it was exercised headlessly with Qt's `offscreen` platform plugin configured with a 2560x1440 virtual screen (so windows are not clamped below the target resolutions). For each resolution the real `MainWindow` is created, shown, resized, and the window is captured to a PNG with `QWidget.grab()`. These are genuine rendered frames of the actual widgets, not mockups. They are **not** an interactive click-through session; runtime behaviour that depends on a live identify run (populated results, enabled export buttons) was simulated by forcing the buttons visible for the worst-case wrap test.

Reproduce with:

```
QT_QPA_PLATFORM="offscreen:configfile=tools/offscreen.json" python tools/layout_test.py
```

(`tools/offscreen.json` defines a 2560x1440 virtual screen so windows are not clamped; the script writes PNGs to `test_screenshots/` and prints a PASS/FAIL summary).

Automated checks (all PASS)

Check	Result
Minimum window size is 800x600	PASS
Identify page splitter present, vertical orientation, 2 panes	PASS
Splitter drag (<code>setSize</code>) yields valid non-zero pane sizes	PASS
Window geometry save -> restore round-trip (1500x950 preserved)	PASS
Action buttons never clipped at 1366x768	PASS
Action buttons never clipped at 1440x900	PASS
Action buttons never clipped at 1920x1080	PASS
Action buttons wrap to 2 rows (not clipped) at minimum 800x600	PASS

Full application test suite: **80 passed, 1 skipped** (`pytest -q`).

Lint: `ruff check .` -> **All checks passed!**

Per-resolution results

1366 x 768

- All controls accessible: header, “DVD rips to identify” card with Folder/File pickers, the action button bar, filter box, status tabs (All / Rename / Correct / Review), and the results table with every column.
- Action bar fits on a single row (visible buttons width ~1285 px, no wrap needed).
- Vertical splitter grip visible between the controls block and the results table; dragging redistributes space between the two panes.
- No hidden or clipped content.
- Screenshot: `test_screenshots/identify_1366x768.png`

1440 x 900

- Same controls, more vertical room for the results table.
- Action bar on a single row.
- Splitter functional.
- No hidden or clipped content.
- Screenshot: `test_screenshots/identify_1440x900.png`

1920 x 1080

- Full-HD layout; controls comfortably spaced, results table gets the majority of the vertical space.
- Action bar on a single row.
- Splitter functional.
- No hidden or clipped content.
- Screenshot: `test_screenshots/identify_1920x1080.png`

800 x 600 (minimum window size, stress case)

- Window can actually reach the 800x600 minimum (the old horizontal button box previously imposed a ~1185 px minimum width; the new FlowLayout removes that constraint).
- With every action button forced visible, the bar wraps onto 2 rows (row 1: Identify, Cancel, Preview Renames, Rename for Plex, Undo Last Rename; row 2: Export JSON, Export CSV, Customize View). Nothing is clipped.
- Filter, status tabs, and the results table remain accessible; the table shows a horizontal scrollbar for columns beyond the width, as expected.
- Screenshot: `test_screenshots/identify_800x600_narrow.png`

Summary

All requested resolutions render correctly with no clipped or hidden controls. The vertical splitter lets the user trade space between the options/controls block and the results table, the action button bar adapts by wrapping instead of overflowing on narrow windows, the window honours an 800x600 minimum, and window size/position persist across sessions via `gui_config.json ( window_geometry )` using `QMainWindow.saveGeometry() / restoreGeometry()`. The identify splitter position is likewise persisted (`identify_splitter`).

Results Table and Dialog Improvements (Items 4 & 5)

Date: 2026-09-09

Navigation icon fix

“Build library” and “Manage library” previously used two book-style icons (`FIF.LIBRARY` and `FIF.BOOK_SHELF`) that render almost identically. “Build library” now uses `FIF.ADD` (a plus icon, signalling “create”), while “Manage library” keeps `FIF.BOOK_SHELF`. The two entries are now visually distinct (see `test_screenshots/table_wide_1500.png` - the left navigation shows a magnifier, a plus, and a book).

How these results were produced

Same method as above: real widgets exercised under Qt's `offscreen` platform with a 2560x1440 virtual screen, captured with `QWidget.grab()`. Automated assertions live in `tools/table_dialog_test.py`; demonstration screenshots are produced by `tools/table_shots.py`. These are rendered frames, not an interactive click session; the header right-click menu and drag-to-reorder are verified programmatically (menu construction, `moveSection`, persistence round-trip) rather than by simulating mouse gestures.

Reproduce with:

```
QT_QPA_PLATFORM="offscreen:configfile=tools/offscreen.json" python tools/
table_dialog_test.py
QT_QPA_PLATFORM="offscreen:configfile=tools/offscreen.json" python tools/
table_shots.py
```

Item 4 - results table (30 automated checks, all PASS)

Area	Result
Long text elides with “...” (<code>ElideRight</code> , word-wrap off)	PASS
Every text cell has a tooltip carrying its full value	PASS
Horizontal + vertical scrolling is per-pixel (smooth)	PASS
Column headers are drag-to-reorder (<code>setSectionsMovable</code>)	PASS
Header right-click menu has a checkable entry per column	PASS
Column priority defined (Status > Episode > Match% > File > Title > Suggested > Agree)	PASS
Auto-hide: nothing hidden $\geq 1000\text{px}$; more hidden as width shrinks	PASS
Essential columns (Select, Status, Episode, Match%, Notes) never auto-hidden or user-hidden	PASS
Widening restores auto-hidden columns	PASS
User show/hide choice persists (<code>column_hidden</code>)	PASS
Column order persists and restores in a new session (<code>column_order</code>)	PASS

Auto-hide thresholds (table viewport width): $< 1000\text{px}$ hides Samples Agree;
 $< 900\text{px}$ also hides Suggested Name; $< 780\text{px}$ also hides Episode Title;
 $< 640\text{px}$ also hides File. Essentials always remain, and a horizontal scrollbar covers anything that still does not fit.

Screenshots:

- `test_screenshots/table_wide_1500.png` - all columns visible at 1500px.
- `test_screenshots/table_1366x768.png` - 1366x768 target, all columns fit, long Episode Title / Suggested Name cells show the ellipsis.
- `test_screenshots/table_narrow_860.png` - at 860px, Episode Title, Suggested Name and Samples Agree are auto-hidden; Status text elides (“Rena...”).

Item 5 - dialogs (Preview Renames, Customize View)

Check	Result
Preview dialog height capped at 80% of screen	PASS
Preview dialog file list scrolls; button row fixed at bottom	PASS
Preview dialog buttons wrap via FlowLayout on narrow windows	PASS
Preview dialog min width clamped to fit small screens	PASS
Customize dialog content wrapped in a <code>QScrollArea</code>	PASS
Customize dialog height capped at 80%; buttons in FlowLayout	PASS
Customize dialog still reports checkbox selections correctly	PASS

Screenshot: `test_screenshots/dialog_preview_renames.png` - a 60-item preview list scrolling with the Cancel / Proceed with copy buttons fixed at the bottom (captured mid fade-in, hence the light appearance).

Persistence keys added to `gui_config.json` (under `identify_page`)

- `column_order` - list of logical column indices in the user's chosen order.
- `column_hidden` - list of logical column indices the user chose to hide.

(`column_widths` , `sort_col` , `sort_order` , `status_filter` were already persisted.)

Summary

All 30 table/dialog automated checks pass, plus the full application suite (80 passed, 1 skipped) and `ruff` remain clean. The duplicate navigation icon is resolved.
