

EpisodeSleuth - Responsive Layout Test Report

Date: 2026-09-09

Scope: Main-window layout improvements (splitter, adaptive button bar, window-geometry persistence, minimum window size) verified across the three requested target resolutions plus a minimum-size stress case.

How these results were produced

The GUI is a PySide6 / QFluentWidgets desktop application, so it was exercised headlessly with Qt's `offscreen` platform plugin configured with a 2560x1440 virtual screen (so windows are not clamped below the target resolutions). For each resolution the real `MainWindow` is created, shown, resized, and the window is captured to a PNG with `QWidget.grab()`. These are genuine rendered frames of the actual widgets, not mockups. They are **not** an interactive click-through session; runtime behaviour that depends on a live identify run (populated results, enabled export buttons) was simulated by forcing the buttons visible for the worst-case wrap test.

Reproduce with:

```
QT_QPA_PLATFORM="offscreen:configfile=tools/offscreen.json" python tools/layout_test.py
```

(`tools/offscreen.json` defines a 2560x1440 virtual screen so windows are not clamped; the script writes PNGs to `test_screenshots/` and prints a PASS/FAIL summary).

Automated checks (all PASS)

Check	Result
Minimum window size is 800x600	PASS
Identify page splitter present, vertical orientation, 2 panes	PASS
Splitter drag (<code>setSize</code>) yields valid non-zero pane sizes	PASS
Window geometry save -> restore round-trip (1500x950 preserved)	PASS
Action buttons never clipped at 1366x768	PASS
Action buttons never clipped at 1440x900	PASS
Action buttons never clipped at 1920x1080	PASS
Action buttons wrap to 2 rows (not clipped) at minimum 800x600	PASS

Full application test suite: **80 passed, 1 skipped** (`pytest -q`).

Lint: `ruff check .` -> **All checks passed!**

Per-resolution results

1366 x 768

- All controls accessible: header, “DVD rips to identify” card with Folder/File pickers, the action button bar, filter box, status tabs (All / Rename / Correct / Review), and the results table with every column.
- Action bar fits on a single row (visible buttons width ~1285 px, no wrap needed).
- Vertical splitter grip visible between the controls block and the results table; dragging redistributes space between the two panes.
- No hidden or clipped content.
- Screenshot: `test_screenshots/identify_1366x768.png`

1440 x 900

- Same controls, more vertical room for the results table.
- Action bar on a single row.
- Splitter functional.
- No hidden or clipped content.
- Screenshot: `test_screenshots/identify_1440x900.png`

1920 x 1080

- Full-HD layout; controls comfortably spaced, results table gets the majority of the vertical space.
- Action bar on a single row.
- Splitter functional.
- No hidden or clipped content.
- Screenshot: `test_screenshots/identify_1920x1080.png`

800 x 600 (minimum window size, stress case)

- Window can actually reach the 800x600 minimum (the old horizontal button box previously imposed a ~1185 px minimum width; the new FlowLayout removes that constraint).
- With every action button forced visible, the bar wraps onto 2 rows (row 1: Identify, Cancel, Preview Renames, Rename for Plex, Undo Last Rename; row 2: Export JSON, Export CSV, Customize View). Nothing is clipped.
- Filter, status tabs, and the results table remain accessible; the table shows a horizontal scrollbar for columns beyond the width, as expected.
- Screenshot: `test_screenshots/identify_800x600_narrow.png`

Summary

All requested resolutions render correctly with no clipped or hidden controls. The vertical splitter lets the user trade space between the options/controls block and the results table, the action button bar adapts by wrapping instead of overflowing on narrow windows, the window honours an 800x600 minimum, and window size/position persist across sessions via `gui_config.json ( window_geometry )` using `QMainWindow.saveGeometry() / restoreGeometry()`. The identify splitter position is likewise persisted (`identify_splitter`).
