

EpisodeSleuth - MSIX Install Report

This report captures the results of side-loading the self-signed MSIX package on a real Windows 10/11 machine. The MSIX must be built, signed and installed on Windows: the CI Windows runner produces and signs the package, and a human performs the install and captures the screenshots below.

Why not automated end-to-end here: `makeappx.exe`, `signtool.exe` and `Add-AppxPackage` are Windows-only. The build/sign half now runs on GitHub's Windows runner (see `.github/workflows/ci.yml`); the install half must be run on a Windows PC. This template is filled in during that install.

Environment

Field	Value
Windows edition / version	e.g. Windows 11 Pro 23H2 (fill in)
Machine	e.g. Desktop, 16 GB RAM (fill in)
Release tested	e.g. v1.0b (fill in)
MSIX file	<code>EpisodeSleuth_1.0.0.0.msix</code>
Certificate	<code>episodesleuth_selfsign.cer</code>
Tester	Josh Barton
Date	(fill in)

Steps performed

1. Download the assets from the GitHub Release

From the release page, download both files attached by CI:

- `EpisodeSleuth_1.0.0.0.msix`
- `episodesleuth_selfsign.cer`

2. Trust the self-signing certificate (one time, elevated PowerShell)

A self-signed package will not install until its certificate is trusted.

Run an **Administrator** PowerShell in the download folder:

```
Import-Certificate -FilePath .\episodesleuth_selfsign.cer `
-CertStoreLocation Cert:\LocalMachine\TrustedPeople
```

Expected: the cert is added to Local Machine\Trusted People .

[SCREENSHOT 1] - PowerShell showing the Import-Certificate output (thumbprint + subject CN=EpisodeSleuth).

3. Install the package

Double-click EpisodeSleuth_1.0.0.0.msix to open the App Installer, or run:

```
Add-AppxPackage -Path .\EpisodeSleuth_1.0.0.0.msix
```

Expected: App Installer shows the EpisodeSleuth name, publisher CN=EpisodeSleuth and an **Install** button; the install completes without error.

[SCREENSHOT 2] - The App Installer dialog (name + publisher + Install button), or the PowerShell prompt returning with no error.

4. Verify the app is registered

```
Get-AppxPackage *EpisodeSleuth*
```

Expected: one entry, Name : Abacus.EpisodeSleuth , Version : 1.0.0.0 .

[SCREENSHOT 3] - Get-AppxPackage output for EpisodeSleuth.

5. Launch and smoke-test

Launch EpisodeSleuth from the Start menu. Confirm:

- A single main window opens (no duplicate/second window).
- The Build Library and Settings pages scroll correctly.
- Building a small library shows elapsed time + per-file status.

[SCREENSHOT 4] - The running app main window.

Result

Check	Pass / Fail	Notes
Certificate imported		
Package installed		
Package registered (Get -AppxPackage)		
App launches (single window)		
Library build + status works		

Overall: PASS / FAIL

Observations / issues: (fill in)
